2 Student Grades

Create a dictionary where the keys are student names and the values are their grades.

Allow the user to:

Add a new student and grade.

Update an existing student's grade.

Print all student grades.

Used dictionary and basic operations. Using if else:

```
studentGrades.py > ...
1 dict_std = {"John": 'C', "Sherly": 'D', "Manya": 'A', "Carol": 'B', "Aman": 'F'}
2 print(dict_std)
3 dict_std["Ken"] = 'B'
4 print(dict_std)
5 dict_std["Carol"] = 'A'
6 print(dict_std)
```

```
PS E:\My Learnings\Devops\PythonLearnings> & "C:\Program Files\Python314\python.exe" "e:/My Learnings/Devops/PythonLearnings/studentGrades.py"
{'John': 'C', 'Sherly': 'D', 'Manya': 'A', 'Carol': 'B', 'Aman': 'F'}
{'John': 'C', 'Sherly': 'D', 'Manya': 'A', 'Carol': 'B', 'Aman': 'F', 'Ken': 'B'}
{'John': 'C', 'Sherly': 'D', 'Manya': 'A', 'Carol': 'A', 'Aman': 'F', 'Ken': 'B'}
```

3. Write to a File

Write a program to create a text file and write some content to it.

Using file functions like write and open.

The screenshot shows the Visual Studio Code interface. The Explorer pane on the left shows a project named 'PYTHONLEARNINGS' with files 'example.txt', 'first.py', 'gradechecker.py', 'studentGrades.py', and 'writetoFile.py'. The main editor shows 'writetoFile.py' with the following code:

```
1 open('example.txt', 'w').close()
2
3 f = open('example.txt', 'w')
4 f.write("This is my first python program using file operations")
5 f.close()
```

The right pane shows 'example.txt' with the content:

```
1 This is my first python program using file operations
```

The bottom terminal pane shows the command prompt with the command to run the script:

```
PS E:\My Learnings\Devops\PythonLearnings> "C:\Program Files\Python314\python.exe" "e:/My Learnings/Devops/PythonLearnings/writetoFile.py"
```

4. Read from a File

We used open in read mode and file.read to read and print to display.

The screenshot shows the Visual Studio Code interface. The Explorer pane on the left shows the same project as the previous screenshot, with 'readfromFile.py' added. The main editor shows 'readfromFile.py' with the following code:

```
1 f = open('example.txt', 'r')
2 data = f.read()
3 print(data)
4 f.close()
```

The right pane shows 'example.txt' with the same content as before.

The bottom terminal pane shows the command prompt with the command to run the script:

```
PS E:\My Learnings\Devops\PythonLearnings> "C:\Program Files\Python314\python.exe" "e:/My Learnings/Devops/PythonLearnings/readfromFile.py"
```

The output of the script is displayed in the terminal:

```
This is my first python program using file operations
```

Submission Guidelines :- Attach Screenshots or command along with explanation and submit in doc(google doc or microsoft doc) format or share github link
